                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A55875

*Xanthine dehydrogenase (EC 1.1.1.204) - Emericella nidulans
Nylternate names: purine hydroxylase I
C; Alternate names: purine hydroxylase I
C; Species: Emericella nidulans, Aspergillus nidulans
C; Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
C; Accession: A55875; A9819
R; Glattigny, A.; Scazzocchlo, C.
J. Biol. Chem. 270, 3534-3550, 1995
A; Title: Cloning and molecular characterization of hxA, the gene coding for the xanthine
A; Reference number: A55875; MUID:95181302
A; Accession: A55875
A; Molecule type: DNA
A; Residues: 1-1363 < GLA>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Introns: 83/3; 151/3; 803/2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hum. Mol. Genet. 3:125-131(1994).
-!- FUNCTION: THIS GLYCOPROTEIN, PRODUCED BY THE SERTOLI CELLS OF THE TESTIS, CAUSES REGRESSION OF THE MUELLERIAN DUCT. IT ALSO IS ABLE TO INHIBIT THE GROWTH OF TUMORS DERIVED FROM TISSUES OF MUELLERIAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               OTHERWISE NORMAL MALES.
-!- MISCELLANDOUS: ALTHOUGH IT DOES NOT COMPETE WITH EGF FOR RECEPTOR BINDING SITES, MIS CAN INHIBIT THE AUTOPHOSPHORYLATION OF THE EGF RECEPTOR IN VITRO.
-!- SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                              Damerdin J.E., McCready P.M., Skowronski E., Adamson A.W.,

-I- FUNCTION: THIS PROTEIN IS A COMPONENT OF THE ACETYL COENZYME A CARBOXYLASE COMPLEX: FIRST, BIOTIN CARBOXYLASE CATALYZES THE CARBOXYLATION OF THE CARRIET PROTEIN AND THEN THE TRANSCARBOXYLASE TRANSFERS THE CARBOXYL GROUP TO FORM MALONYL-COA (BY SIMILARITY).

-I- CATALYTICA ACTIVITY: CARBOXYL CARRIER PROTEIN + MALONYL-COA.

ACETYL-COA - BIOTIN CARBOXYL CARRIER PROTEIN + MALONYL-COA.

-I- PATHWAY: FIRST STEP IN LONG-CHAIN FATTY ACID SYNTHESIS.

-I- SUBUNIT: ACETYL-COA CARBOXYLASE IS AN HETEROHEXAMER OF BIOTIN CARBOXYL CARRIER PROTEIN, BIOTIN CARBOXYLASE AND THE TWO SUBUNITS OF CARBOXYL TRANSFERASE IN A 2:2 COMPLEX (BY SIMILARITY).

-I- SIMILARITY: TO THE C-TERMINUS OF MANMALIAN PROPIONYL-COA
                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright. Degano M., Gopaul D.N., Scapin G., Schramm V.L., Sacchettini J.C.;

Three-dimensional structure of the inosine-uridine nucleoside N-
Tribohydrolase from Crithidia fasciculata...;

Biochemistry 35:5971-5981(1996).

-I- FUNCTION: CATALYZES THE HYDROLYSIS OF ALL OF THE COMMONLY

OCCURRING PURINE AND PYRIMIDINE NUCLEOSIDES INTO RIBOSE AND THE
ASSOCIATED BASE, BUT HAS A PREFERENCE FOR INOSINE AND URIDINE AS SUBSTRATES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     116 LGIPQDLIGDLASLAFGSQRPLLDSVAQQQGSSLPHVSYF----RWRVDVAISTSAQSRS 171

Mean 45.912; Variance 95.996; scale 0.478 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Submitted (OCT-1997) to the EMBL/GenBank/DDBJ databases.

-1- FUNCTION: PARTICIPATES IN LIPASE PRODUCTION. THE LIPASE GENE IS
WELL EXPRESSED ONLY IN THE PRESENCE OF THIS PROTIEN WHICH EXERTS
ITS EFFECT BOTH IN CIS AND IN TRANS. IT MAY IN SOME WAY
PARTICIPATE IN THE SECRETION OF THE LIPASE (BY SIMILARITY).
-1- SIMILARITY: HIGH, WITH OTHER MODULATORS OF THE PRODUCTION OF
LIPASES IN OTHER PSEUDOMONAS SPECIES.

Minimum Match 0% Listing first 45 summaries

Database:

pir62 1:pir1 2:pir2 3:pir3 4:pir4

Mean 46.697; Variance 102.828; scale 0.454

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#journal Genes Dev. (1994) 8:869-884
#title Molecular cloning and functional analysis of the adenovirus
ElA-associated 300-kD protein (p300) reveals a protein with
properties of a transcriptional adaptor.
#accession A54277
#status
 #authors Meinhardt, L.W.; Krishnan, H.B.; Balatti, P.A.; Pueppke, S.G. #journal Mol. Microbiol. (1993) 9:17-29
#title Molecular cloning and characterization of a sym plasmid locus that regulates cultivar-specific nodulation of soybean by Rhizobium fredil USDA257.
#cross-references MUD:94018604
#accession S35020
 ##residues 1-21/4 ##label ECK
##cross_references GB:U01877; NID:g495300; PIDN:AAA18639.1; PID:g495301
##note in the authors' translation 941-Ser is shown after 961
and consequently, residues 942-961 are displaced one codon to the left

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 33.179; Variance 157.131; scale 0.211

New tumorigenesis associated protein and related nucleic acid, vectors, transformed cells - antibodies, agonists and antagonists, vectors, transformed cells - antibodies, agonists and antagonists, for diagnosis, treatment and prevention of abnormal cellular differentiation, particularly cancers and inflammation.

This is the amino acid sequence of the human tumourigenesis associated protein (HTAP), used in the method of the invention. HTAP, is involved with cell proliferation and inflammation. It can be used to stimulate cell proliferation and inflammation. It can be used to stimulate cell proliferation of tumours or infections, or to treat genetic defects). Antagonists of HTAP are used to treat or prevent a wide range of cancers (adenocazcinoma, melanoma, sarcoma, lymphoma, leukaemia etc.), also inflammation where associated with infection or anthritis). HTAP is also used to raise antibodies are used as for diagnosis or monitoring of HTAP-related diseases (in usual immonoassays), in competifitie drug screens and to isolate HTAP from immunoassays), in competifitie drug screens and to isolate HTAP from standard amplification or hybridisation tests to diagnose HTAP-related diseases; to identify related sequences; for genomic mapping and for screening for specific inhibitors.

proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 101 polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal efficiencies, blood disorders, leukemiss, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lumphomas; inflammation, allergies, Alzheimer's and cognitive disorders, pulmonary disorders, transplant rejection, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, diseative/endocrine disorders, infections and AIDS. The human secreted proteins of the invention are represented in X37451-X37552.

 New manumalian Zneul polypeptides - used to, e.g. treat Alzheimer's disease, cancer and to repopulate blood cells

Zlaim 6; Page 57-58; 70pp; English.

This claimed polypeptide comprises amino acid residues 105-273 of the human Zneul mature protein (see W88382), i.e. the 2 epidermal growth factor-like domains (see also W88384-85) and the second HSMHC3W5A homology domain of Zneul. Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast cancer, glioblastomas, and plutitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells cancer, glioblastomas, and plutitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells cancer menotherapy, to stimulate myofilroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed cancer inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in diagnostic assays.

Wew manumalian Zneul polypeptides - used to, e.g. treat Alzheimer's disease, cancer and to repopulate blood cells

Glaim & Page 48.49; 70pp; English.

This polypeptide comprises human Zneul mature polypeptide. Zneul closest human homologue is HSMHC3M5A, a gene in the HLA class III region, which is contained in a cosmid which contains Notch 4.

To region, which is contained in a cosmid which contains Notch 4.

Cancul is also homologue to Notch 4 in its EGF-like domains and may be involved in EGF receptor pathways. Zneul is widely expressed in adult tissues, with high expression in heart, placenta, spleen, testis, thyroid, spinal cord and lymph node. Zneul can be used as growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. In may law a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used to treat Alzheimer's disease, adenomas. Zneul may also be used to treat Alzheimer's disease, and in the placenta, in fertility and contraception, or to myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to including specific domains of Zneul and epitope-bearing portions of cancer.  New manumalian Zneul polypeptides - used to, e.g. treat Alzheimer's disease, cancer and to repopulate blood cells

I disease, cancer and to repopulate blood cells

Claim 6; Page 47-48; 70pp; English.

This polypeptide comprises human Zneul, a new neuro-growth factor-

I like protein. Its amino acid sequence was deduced from the nucleotide sequence (see V84341) of a CDNA clone isolated from a commit on the HLA class III region, which is contained in a cosmid which contains Notch 4. Zneul is also homologue is HSMHC3W5A, a gene in the HLA class III region, which is contained in a cosmid which contains Notch 4. Zneul is also homologues to Notch 4 in its GGF-like domains and may be involved in EGF receptor pathways.

EGF-Like domains and may be involved in EGF receptor pathways.

Eneul is widely expressed in adult tissues, with high expression in heart, placenta, spleen, testis, thyroid, splinal cord and lymph nodes. Zneul polypeptide can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may also play a role in breast cancer, cliobiastomas, and pituitary adenomas. Zneul may be used to treat chemotherapy, to stimulate myofibroblast prolliferation, stimulate contractors and envise. Claimed Zneul into to respond to the placenta, in fertility and contraction.
 can be used to raise

 Disclosure: Page 61-78; 126pp; English.

Transcription factor p300 was isolated from human 293 cells and used to generate polyclonal antisera in mice. These were used to screen 293 cDNA libraries to isolate clones conty. overlapping inserts, which were assembled to obtain a full-length cDNA sequence (T02792)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                          ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated p300/CBP-associated factor, P/CAF - used to develop products for modulating transcription, e.g. for treating HIV products for modulating transcription, e.g. for treating HIV products for modulate or for promoting muscle differentiation or access or for promoting muscle differentiation or particular page 76-81; 107pp; English.

This polypeptide sequence comprises p300, a global transcriptional coactivator that is involved in the regulation of various DNA-binding transcriptional factors. The invention relates to a novel human p300/CBP associated cofactor, P/CAF (see W40052), that modulates transcription through binding to p300 and CBP (see W40058). The region (see W40055) of p300 that binds to P/CAF is claimed. The Invention provides methods of screening for compounds that inhibit or stimulate the transcription modulating and histone acetyltransferase activity of P/CAF and p300/CBP.

Inhibitors can be used e.g. to inhibit HIV TAT-mediated transcription in the treatment of HIV infection. Stimulators can be used e.g. to activate tumour suppressor p53 in the treatment of cancer or to activate the muscle differentiation factor MyoD to promote muscle differentiation. The products can also be used to inhibit the cell cycle progression inducing effect of an oncoprotein which binds p300/CBP in a subject. Also provided is contacting the sample with the P/CAF binding region of p300 and determining the amount of P/CAF in a sample by sequence 2414 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

New nucleic acid sequences encoding enzymes involved in macrolide bosynthesis. - useful for producting hybrid secondary metabolites, particularly erythromycin analogues claim 6; Fig 2; 221pp; French.
This sequence represents the dTDP-4-keto-L-6-deoxyhexose-3,4-isomerase enzyme encoded by the eryCII gene from the eryG-eryAIII gene cluster from the Gram-positive bacterium Saccharopolyspora erythraea. This gene cluster encodes enzymes involved in the production of the macrolide antibiotic erythromycin as a secondary metabolite. The erythromycin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-JUN-1999 (first entry)
S.erythraea dTDP-4-keto-L-6-deoxyhexose-3,4-isomerase.
Gene cluster, bacterium; enzyme; macrolide; antibiotic; erythromycin; secondary metabolite; eryBlI; eryCIII; eryCIII; hybridisation; probe; glycosylation; macrolactone; oleandomycin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   60 QGEDCRDGVQRLGVSANLPEEQLGALLAGMHTLLQQALRLPPTSLKPDTFRDQLQELCIP 119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   150 MTAVLGAAGVLR--GAAWDARVS-LDAQLSPQQLAVTEAAVAALPADPALRAL-FAGAEM 205

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            R77317 represents a mew protein-activated lipase. The protein is produced as a fusion protein with glutathionine transferase. The protein has an amino acid sequence of 339 residues and a molecular weight of 39 kD. The method used to produce the new protein yields active lipase of very high purity without using any complex purification process such as chromatography.
                                                                                                                                                                                                                                                                                                                                                                                                                                        fusion

Claim 4: Page 86-88: 99pp; English.

Claim 4: Page 86-88: 99pp; English.

The present sequence is an isolated capaaicin receptor polypeptide

(I). Capsalcin polypeptides are useful for identifying binding compounds

which affect cellular responses. Preferably this is for identifying a

compound that binds (I) and affects a cellular response associated with

capsalcin biological activity (e.g. intracellular calcium flux). The

polypeptides and host cells are useful for detecting a vanilloid

compound (an essential structural component of capsalcin) from natural

products by detecting an alteration of intracellular response associated

with capsalcin receptor activity, preferably an alteration of

intracellular calcium levels, and are useful for screening for compounds

for use in analgesics. Capsalcin receptor polypeptides and antibodies

are useful for diagnosis and treatment of human diseases and painful

syndromes. The transgenic mammals can be used to screen for capsalcin

receptor antagonists and agonists. Prior art methods for iscreening or

characterising new capsalcin receptor-binding compounds relied on assays

polypeptides provide a more sensitive screen.

In Pseudomonas species - by cloning a lipase gene and a lipase modulator gene into a homologous Pseudomonas species benedictured in the lipase gene from Pseudomonas pseudoalcaligenes MI was cloned in E. coli as in EP-334462. The DNA sequence of insert Pvul/EcoRI contains two open reading frames, one encoding the lipase gene, the other encoding a putative lipase modulator gene which increases the lipase productivity in a homologous host cell. The lipase obtd. is used for hydrolysing lipids in e.g. fats and oil processing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 47.784; Variance 95.999; scale 0.498

SLUMITE G. (JUN-1998) to the EMBL/GenBank/DDBJ databases.

-I. FUNCTION: BINDS TO THE INTRACELLUAR DOMAIN OF TUMOR NECROSIS FACTOR TYPE I RECEPTOR.

-I TISSUE SPECIFICITY: FOUND IN SKELETAL MUSCLE, LIVER, HEART, BRAIN,

KINDEY, PANCREAS, LUNG AND PLACENTA.

chromosome VI from Saccharomyces cerevisiae.";
Yeast 12:177-190(1996).
-!- FUNCTION: INVOLVED IN CHROMOSOME SEGREGATION IN MITOSIS. COULD BE PART OF A CHROMOSOME CONDENSATION MOTOR.
-!- SUBBUILT: HOMODIMER OR HETERODIMER WITH SMC1 OR OLIGOMERS.
-!- SUBCELLULAR LOCATION: NUCLEAR.
-!- DOMAIN: CONSISTS OF TWO PUTATITY CENTRAL COILED-COIL REGIONS FLANKED BY PUTATIVE GLOBULAR REGIONS AT THE N- AND C-TERMINUS.
-!- SIMILARITY: BELONGS TO THE SMC FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DAI J., BAXTER R.C.; "Molecular cloning of the acid-labile subunit of the rat insulin-like growth factor binding protein complex."; Biochem. Natl. Acad. Sci. U.S.A. 93:10028-10033(1996).

-! FUNCTION: MAY HAVE AN IMPORTANT ROLE IN REGULATING THE ACCESS OF CIRCULATING IGFS TO THE TISSUES.

-! SUBDINI: FORMS A TERNARY COMPLEX OF ABOUT 140 TO 150 KD WITH IGF-I OR IGF-II AND IGFBP-3 (BY SIMILARITY).

-! SUBCELLULAR LOCATION: EXTRACELULAR.

-! SIMILARITY: THE REPEATED LEUCINE-RICH (LRR) SEGMENT IS FOUND IN MANY PROTEINS. NUMBER IN THIS PROTEIN: 20.

DELHANTY P., BAXTER R.C.;

"The clouding and expression of the baboon acid-labile subunit of the insulin-like growth factor binding protein complex.";

Blochem. Biophys. Res. Commun. 227:897-902(1996).

-i- FUNCINON: INVOLVED IN PROTEIN-PROTEIN INTERACTIONS THAT RESULT IN PROTEIN COMPLEXES, RESEPPON-LICAND BINDING OR CELL ADHESION.

-I- SUBUNIT: FORMS A TERNARY COMPLEX OF ABOUT 140 TO 150 KD WITH IGF-I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     272 DLSHNRVAGLLEDTFPGLLGLHVLRLAHNAITSLRPRTFKDLHFLEELQLGHNRIRQLGE 331

This claimed polypetide comprises amino acid residues 1-85 and 159-234 of the human Zneul mature protein (see W88382). i.e. the first HSMHG3W5a homology domain fused to the second HSMHG3W5a homology domain of Zneul. Is a new neuro-growth factor-like homology domain of Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast to treat Alzheimer's disease, cancer, or epopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Earlility and contraception, or to regenerate nerves. Claimed Earlility and contraception, or to regenerate nerves. Claimed Sneul polypeptides (see also W8882-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to
 New mammalian Zneul polypeptides - used to, e.g. treat Alzheimer's disease, cancer and to repopulate blood cells claim 6; Pege 48-49; 70pp; English.

This polypeptide comprises human Zneul mature polypeptide. Zneul is a new neuro-growth factor-like protein (see also W88381). Its closest human homologue is HSMC3W5A, a gene in the HLA class III region, which is contained in a cosmid which contains Notch 4. Zneul is also homologous to Notch 4 in its EGF-like domains and may

be involved in BGF receptor pathways. Zneul is widely expressed in adult tissues, with high expression in heart, placenta, spleen, testis, thyroid, spinal cord and lymph node. Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of cancer, can be used to raise specific antibodies for use e.g. in
 New manualian Zneul polypeptides - used to, e.g. treat Alzheimer's disease, cancer and to repopulate blood cells

Claim 6; Page 47-48; 70pp; English.

This polypeptide comprises human Zneul, a new neuro-growth factoring polypeptide comprises human Zneul, a new neuro-growth factoring protein. Its amino acid sequence was deduced from the nucleotide sequence (see V84341) of a CDNA clone isolated from a brain cDNA library. Zneul's closest human homologue is HSMRG3N5A, a gene in the HLA class III region, which is contained in a cosmid which contains Notch 4. Zneul is also homologous to Notch 4 in its EGF-like domains and may be involved in EGF receptor pathways.

EGF-like domains and may be involved in some committee of the contain is widely expressed in adult tissues, with high expression in heart, placenta, spleen, testis, thyroid, spinal cond and lymph code. Zneul polypeptide can be used as a growth, maintenance, or

New tumorigenesis associated protein and related nucleic acid, vectors, transformed cells - antibodies, agonists and antagonists, tor diagnosis, treatment and prevention of abnormal cellular differentiation, particularly cancers and inflammation

To diagnosis, treatment and prevention of abnormal cellular differentiation, particularly cancers and inflammation.

This is the amino acid sequence of the human tumourigenesis associated protein (HTMP), used in the method of the invention. HTMP, constitution acid sequence of the human tumourigenesis associated protein (HTMP), used in the method of the invention. HTMP, is involved with cell proliferation and inflammation. It can be used to stimulate cell proliferation for tumours or infections, or to treat genetic defects). Antagonists of HTMP are used to treat or prevent a wide range of cancers (adenocarcinoms, melanoma, sarroma, lymphoma, cellukaemia etc.), also inflammation where associated with infection or immunological disease (e.g. asthma, cystic fibrosis, rheumatoid arthritis). HTMP is also used to raise antibodies are used as for diagnosis or monitoring of HTMP-related diseases (in usual immonsassys), in competitive drug screens and to isolate HTMP from standard amplification or hybridisation tests to diagnose HTMP-related diseases, to identify related sequences; for genomic mapping and for screen.

Claim 1b; Page 285-286; 368pp; English.

This invention describes novel isolated human genes and the secreted proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides.

Specific uses are described for each of the 101 polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, schizophrenia, prostate allergies, Alzhelmer's and cognitive disorders, pulmonary disorders, transplant rejection, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, disease, schizophrenia, osteoporosis, arthritis or malignancies, disease, schizophrenia or cardiae masche disorders, pulmonary disorders, infections and AIDS. The human secreted proteins of the invention are represented in X77852-X07993 and the encoding nucleic acids are represented in X37451-X37552.
 Human secreted protein fragment encoded from gene 16.

WEW WD-40 (beta-transducin)-derived polypeptide(s) - which alter the activity of a protein, eg. protein kinase C, which interacts with a rotein contg. a WD-40 region.

Example 5; Page 122-125; 351pp; English.

Example 5; Page 122-125; 351pp; English.

Example 5; Page 122-125; 351pp; English.

Proteins R65851-92 are protein which contain at least one WD-40 (also called beta-transducing homologous) amino acid repeat motifs. The WD-40 regions are involved in protein. Protein interactions between proteins funase of involved in intracellular signalling. An example of such an interaction is between protein kinase of and receptors of activated protein kinase (RACK), esp. RACK-1 (R86850). Proteins R85851-82 were isolated based on homology with beta-transducin, whereas proteins R85881-92 were isolated proteins were used to construct the peptides R8423-R85663 and R85786-R85842. The peptides can be used to identify target proteins contg. WD-40 motifs, as modulators of enzyme esp. isozyme, activity of proteins involved in protein-protein interaction and to screen for drugs contg. And at all affect protein-protein interaction involving WD-40 domains.

Particular and proposed and proposed processes and proteins. The polynocleotide encoding mammalian cytokine interleukin-B30 (IL-B30), including fragments - useful for requilating activation, development, differentiation and function of various cell types, and for diagnosing and treating conditions a special types, and for diagnosing and treating conditions of processes and conditions and containing a vector comprising the IL-B30 polypeptides. Host cells containing a vector comprising the IL-B30 polypeptides Host cells containing a vector comprising the IL-B30 polypeptides are useful for diagnosis of IL-B30 mediated conditions, and forensic science (e.g. to distinguish rodent from human, or as marker to distinguish between different cells exhibiting differential expression or modification patterns). The IL-B30 including fragments), together with antibodies that bind to IL-B30 are useful for teaching purposes. They are also used for treating conditions associated with abnormal physiclogy or development, including inflammatory conditions. The polypeptide cytokine should mediate cytokine synthesis and proliferation in cells. IL-B30 is useful for drug screening to dentify compounds having binding affinity to IL-B30. The present
 Didutinin-specific protease(s) - specifically cleave fusion proteins regardless of size, at C-terminus of ubiquitin portion claim 13; page 58-64; 78pp; English.

The sequences given in 18729-31 represent the ubiquitin-specific proteases UBP1, UBP2, and UBP3. These proteases specifically cleave the 120 kD fusion protein ubiquitin-methionine-beta-galactosidase (Ub-met-beta-gal) (see also R36728). The proteases UBP1 and UBP2 active in vivo. These proteases have been shown to specifically cleave Ub-met-beta-gal at the C-terminus of the ubiquitin molety. The proteases can be used to deubiquinate fusion proteins in vivo, therefore prokaryotic cells having an expression vector one of these proteases can be further transformed with an expression vector
 encoding a ubiquitin fusion protein. Such cells will then produce a deubiquinated product having a predetermined N-terminal amino acid
 Ubiquitin-specific protease, UBP3.

 DNA encoding Streptomyces fradiae tylactone synthase domain - for production of tylosin-related polyketide compounds claim 9; Pages 66-80; 220pp; English.
W22601-W22605 represent proteins encoded by the tylactone synthase gene cluster of the invention. The gene cluster is also referred to as the tylactone, and was isolated from Streptomyces fradiae. These sequences are multifunctional proteins which direct the synthesis of the polyketide tylactone, isolated from Streptomyces fradiae. Tylactone is the basic modified so as to alter the type of carboxylic acids incorporated, the number of carboxylic acids incorporated and/or the post-condensation rections performed, thereby resulting in novel tylosin-related

 Thrombopoletin variants having megakaryocyte growth factor, activity useful for promoting growth of megakaryocytes and platelets, also as bloochemical assay reagent
Claim 13: Page 15: 21pp; Japanese.
Four deletion variants of thrombopoletin (TPO), designated dTPO-5, -6, -7 and -8, were engineered. All four variants contained the first 131 residues from the N-terminal region of human TPO and all four variants promoted formation and growth of human megakaryocytes. Proteins comprising at least residues 1-31 of TPO are useful for promoting platelet production. The present sequence is that of dTPO-6 which has the same sequence as wild-type TPO for the first 131 amino acids, followed by residues 319-353 from the C-terminus of

PY condothelial cells

PY for diagnosis and therapy, e.g. modulating homing of leukocytes of tor diagnosis and therapy, e.g. modulating homing of leukocytes of tor diagnosis and therapy, e.g. modulating homing of leukocytes of tor diagnosis and therapy, e.g. modulating homing of leukocytes of tor diagnosis and therapy, e.g. modulating homing of leukocytes of leukocytes of the modulating has a mucine-like region between the 2nd and 3rd comains, a transmembrane domain and a cytoplasmic domain, where the CC Annalins, a transmembrane domain and a cytoplasmic domain, where the MAd is capable of binding to a leukocyte surface membrane protein.

CC And is capable of binding to a leukocyte surface membrane protein.

CC CONA can be used for screening for molecules capable of binding to protein may be used to treat intestinal inflammatory diseases and autoimmune diseases, and especially intestinal carcinomas, etc.

CC CONA can be used to treat intestinal inflammatory diseases and sequence 405 Ax;

CO Sequence 405 Ax;
